

Use Case Integrated Restaurant Ordering & Operational System

Use Case Diagram

1. Customer:

The customer can look at the digital menu. They can choose food, make changes to their order, and add it to a shopping cart. Then, they can place the order.

2. Waitstaff / Server:

The waitstaff can check the bill for the table. They can watch the table status. They can bring the food to the table. They can also take cash payments.

3. Manager:

The manager can change the menu items. They can look at sales reports and data. They can also control what workers can see and do in the system.

4. Kitchen Staff / Chef:

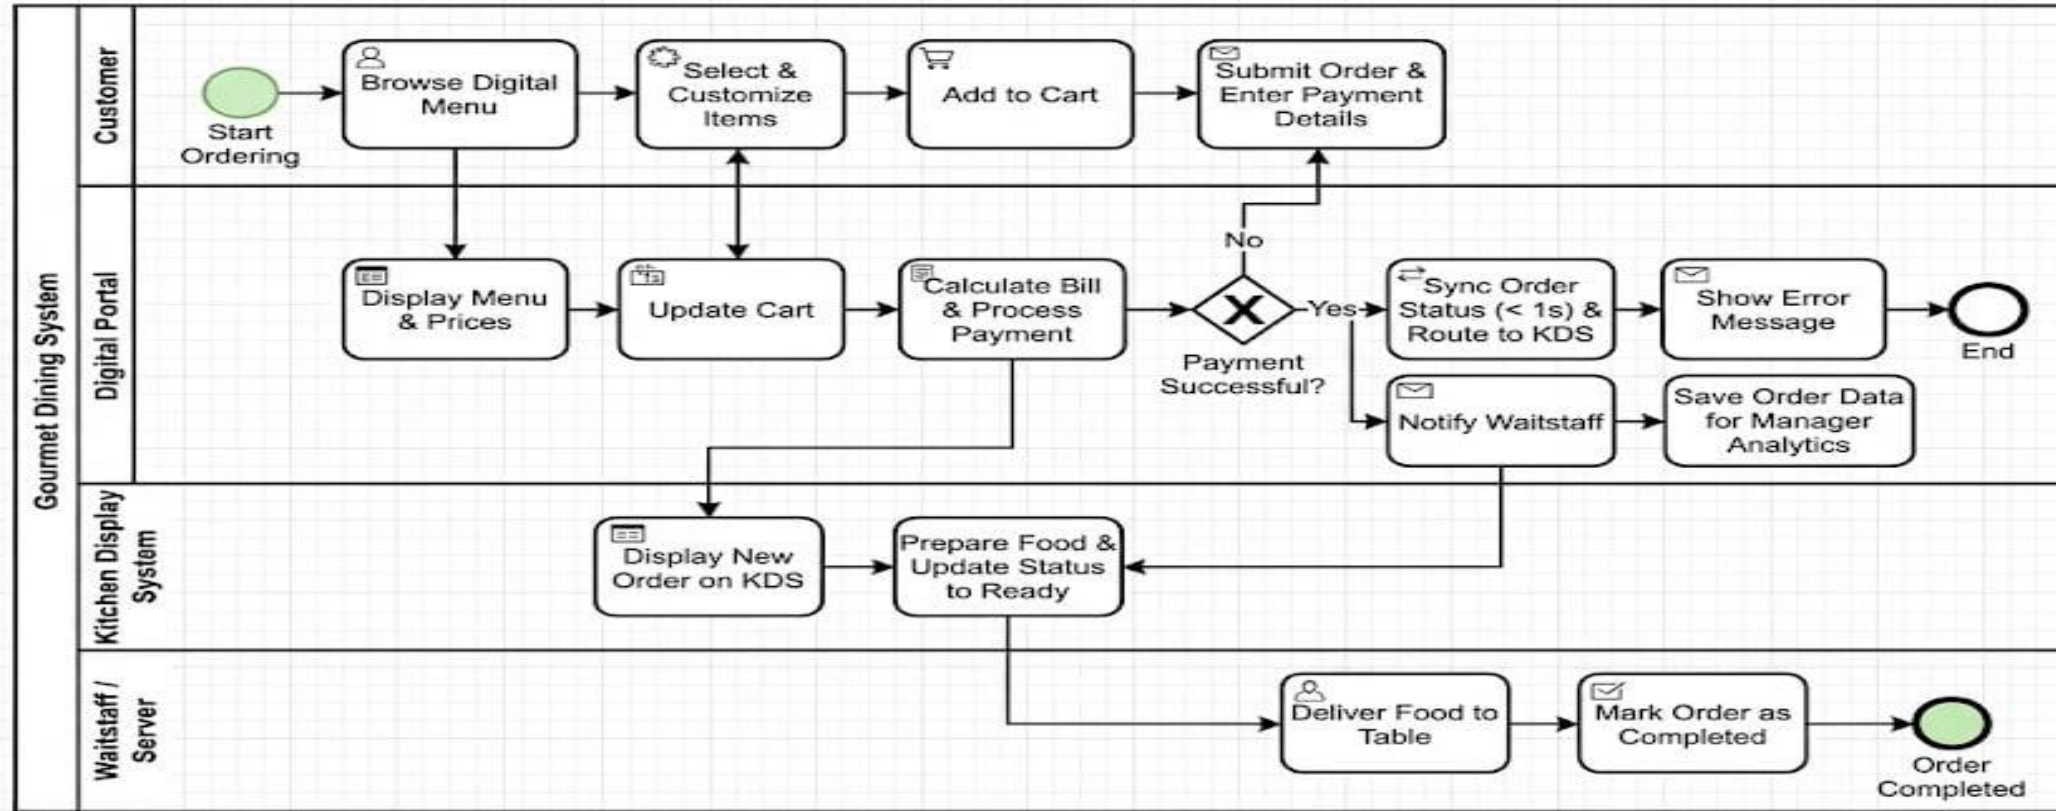

The kitchen staff can see new orders on a screen. They can change the status of the order (for example, from "cooking" to "ready").

5. Payment System:

This is a computer system. It helps the customer make a payment.

BPM End-to-End Restaurant Order & Processing Workflow

BPM Restaurant Order Workflow

BPM Workflow Diagram

Step 1: The Customer

First, the customer starts the order. They browse the digital menu. They select and customize their food. They add the food to the cart. Then, they submit the order and enter their payment details.

Step 2: The Digital Portal

Next, the system shows the menu and prices. It updates the cart and calculates the bill. Then, the system processes the payment.

- If payment is No: The system shows an error message and the order stops.
- If payment is Yes: The system sends the order to the kitchen and tells the waitstaff.

Step 3: The Kitchen

Then, the kitchen screen shows the new order. The kitchen prepares the food and updates the status to "Ready".

Step 4: The Waitstaff

Finally, the waiter delivers the food to the table. They mark the order as completed. The process ends here.
